Charles University, Faculty of Mathematics and Physics NDBI040: **Big Data Management and NoSQL Databases**

Lecture Outline

Graph databases

Introduction

Neo4j

- Data model: property graphs
- Traversal framework
- Cypher query language
 - Read, write, and general clauses

Graph Databases

Data model

- Property graphs
 - Directed / undirected graphs, i.e. collections of ...
 - nodes (vertices) for real-world entities, and
 - relationships (edges) among these nodes
 - Both the nodes and relationships can be associated with additional properties

Types of databases

- Non-transactional = small number of large graphs
- Transactional = large number of small graphs

Graph Databases

Query patterns

- Create, update or remove a node / relationship in a graph
- Graph algorithms (shortest paths, spanning trees, ...)
- General graph traversals
- Sub-graph queries or super-graph queries
- Similarity based queries (approximate matching)

Neo4j Graph Database

Neo4j

Graph database

- https://neo4j.com/
- Features
 - Open source, massive scalability (billions of nodes), high availability, fault-tolerant, master-slave replication, ACID transactions, embeddable, ...
 - Expressive graph query language (Cypher), traversal framework
- Developed by Neo Technology
- Implemented in Java
- Operating systems: cross-platform
- Initial release in 2007

Data Model

Database system structure

 $Instance \rightarrow single~\textbf{graph}$

Property graph = directed labeled multigraph

Collection of vertices (nodes) and edges (relationships)

Graph node

- Has a unique (internal) identifier
- Can be associated with a set of labels
 - Allow us to categorize nodes
- Can also be associated with a set of properties
 - Allow us to store additional data together with nodes

Data Model

Graph relationship

- Has a unique (internal) identifier
- Has a direction
 - Relationships are equally well traversed in either direction!
 - Directions can even be ignored when querying at all
- Always has a start and end node
 - Can be recursive (i.e. loops are allowed as well)
- Is associated with exactly one type
- Can also be associated with a set of properties

Data Model

Node and relationship property

- Key-value pair
 - Key is a string
 - Value is an atomic value of any primitive data type, or an array of atomic values of one primitive data type

Primitive data types

- boolean boolean values true and false
- byte, short, int, long integers (1B, 2B, 4B, 8B)
- float, double floating-point numbers (4B, 8B)
- char one Unicode character
- String sequence of Unicode characters

Sample Data

Sample graph with movies and actors

```
(m1:MOVIE { id: "vratnelahve", title: "Vratné lahve", year: 2006 })
(m2:MOVIE { id: "samotari", title: "Samotáři", year: 2000 })
(m3:MOVIE { id: "medvidek", title: "Medvidek", year: 2007 })
(m4:MOVIE { id: "stesti", title: "Štěstí", year: 2005 })
(a1:ACTOR { id: "trojan", name: "Ivan Trojan", year: 1964 })
(a2:ACTOR { id: "machacek", name: "Jiří Macháček", year: 1966 })
(a3:ACTOR { id: "schneiderova", name: "Jitka Schneiderová", year: 1973 })
(a4:ACTOR { id: "sverak", name: "Zdeněk Svěrák", vear: 1936 })
(m1)-[c1:PLAY { role: "Robert Landa" }]->(a2)
(m1)-[c2:PLAY { role: "Josef Tkaloun" }]->(a4)
(m2)-[c3:PLAY { role: "Ondřej" }]->(a1)
(m2)-[c4:PLAY \{ role: "Jakub" \}]->(a2)
(m2)-[c5:PLAY \{ role: "Hanka" \}]->(a3)
(m3)-[c6:PLAY { role: "Ivan" }]->(a1)
(m3)-[c7:PLAY { role: "Jirka", award: "Czech Lion" }]->(a2)
```

Neo4j Interfaces

Database architecture

- Client-server
- Embedded database
 - Directly integrated within your application

Neo4j drivers

- Official: Java, .NET, JavaScript, Python
- Community: C, C++, PHP, Ruby, Perl, R, ...

Neo4j shell

Interactive command-line tool

Query patterns

- Cypher declarative graph query language
- Traversal framework

Traversal Framework

Traversal Framework

Traversal framework

- Allows us to express and execute graph traversal queries
- Based on callbacks, executed lazily

Traversal description

Defines rules and other characteristics of a traversal

Traverser

- Initiates and manages a particular graph traversal according to...
 - the provided traversal description, and
 - graph node / set of nodes where the traversal starts
- Allows for the iteration over the matching paths, one by one

Traversal Framework: Example

Find actors who played in Medvidek movie

```
TraversalDescription td = db.traversalDescription()
  .breadthFirst()
  .relationships(Types.PLAY, Direction.OUTGOING)
  .evaluator(Evaluators.atDepth(1));
Node s = db.findNode(Label.label("MOVIE"), "id", "medvidek");
Traverser t = td.traverse(s):
for (Path p : t) {
  Node n = p.endNode();
  System.out.println(
   n.getProperty("name")
 );
```

```
Ivan Trojan
Jiří Macháček
```

Traversal Description

Components of a traversal description

- Order
 - Which graph traversal algorithm should be used
- Expanders
 - What relationships should be considered
- Uniqueness
 - Whether nodes / relationships can be visited repeatedly
- Evaluators
 - When the traversal should be terminated
 - What should be included in the query result

Traversal Description: Order

Order

Which graph traversal algorithm should be used?

- Standard depth-first or breadth-first methods can be selected or specific branch ordering policies can also be implemented
- Usage:

```
td.breadthFirst()
td.depthFirst()
```

Traversal Description: Expanders

Path expanders

Being at a given node... what relationships should next be followed?

- Expander specifies one allowed...
 - relationship type and direction
 - Direction.INCOMING
 - Direction.OUTGOING
 - Direction.BOTH
- Multiple expanders can be specified at once
 - When none is provided, then all the relationships are permitted
- Usage: td.relationships(type, direction)

Traversal Description: Uniqueness

Uniqueness

Can particular nodes / relationships be revisited?

- Various uniqueness levels are provided
 - Uniqueness.NONE no filter is applied
 - Uniqueness.RELATIONSHIP_PATH Uniqueness.NODE_PATH
 - Nodes / relationships within a current path must be distinct
 - Uniqueness.RELATIONSHIP_GLOBAL
 Uniqueness.NODE_GLOBAL (default)
 - No node / relationship may be visited more than once
- Usage: td.uniqueness(level)

Traversal Description: Evaluators

Evaluators

Considering a particular path... should this path be included in the result? should the traversal further continue?

Available evaluation actions

- Evaluation.INCLUDE_AND_CONTINUE
 Evaluation.INCLUDE_AND_PRUNE
 Evaluation.EXCLUDE_AND_CONTINUE
 Evaluation.EXCLUDE_AND_PRUNE
- Meaning of these actions
 - INCLUDE / EXCLUDE = whether to include the path in the result
 - CONTINUE / PRUNE = whether to continue the traversal

Traversal Description: Evaluators

Predefined evaluators

- Evaluators.all()
 - Never prunes, includes everything
- Evaluators.excludeStartPosition()
 - Never prunes, includes everything except the starting nodes
- Evaluators.atDepth(depth)
 Evaluators.toDepth(maxDepth)
 Evaluators.fromDepth(minDepth)
 Evaluators.includingDepths(minDepth, maxDepth)
 - Includes only positions within the specified interval of depths
- ...

Traversal Description: Evaluators

Evaluators

- Usage: td.evaluator(evaluator)
- Note that evaluators are applied even for the starting nodes!
- When multiple evaluators are provided...
 - then they must all agree on both the questions
- When no evaluator is provided...
 - then the traversal never prunes and includes everything

Traverser

Traverser

- Allows us to perform a particular graph traversal
 - with respect to a given traversal description
 - starting at a given node / nodes

```
    Usage: t = td.traverse(node, ...)
    for (Path p:t) { ... }
    Iterates over all the paths
    for (Node n:t.nodes()) { ... }
    Iterates over all the paths, returns their end nodes
    for (Relationship r:t.relationships()) { ... }
```

Path

Well-formed sequence of interleaved nodes and relationships

Iterates over all the paths, returns their last relationships

Traversal Framework: Example

Find actors who played with Zdeněk Svěrák

```
TraversalDescription td = db.traversalDescription()
  .depthFirst()
  .uniqueness(Uniqueness.NODE GLOBAL)
  .relationships(Types.PLAY)
  .evaluator(Evaluators.atDepth(2))
  .evaluator(Evaluators.excludeStartPosition());
Node s = db.findNode(Label.label("ACTOR"), "id", "sverak");
Traverser t = td.traverse(s):
for (Node n : t.nodes()) {
 System.out.println(
    n.getProperty("name")
  ):
```

Jiří Macháček

Cypher

Cypher

Cypher

- Declarative graph query language
 - Allows for expressive and efficient querying and updates
 - Inspired by SQL (query clauses) and SPARQL (pattern matching)
- OpenCypher
 - Ongoing project aiming at Cypher standardization
 - http://www.opencypher.org/

Clauses

- E.g. MATCH, RETURN, CREATE, ...
- Clauses can be (almost arbitrarily) chained together
 - Intermediate result of one clause is passed to a subsequent one

Sample Query

Find names of actors who played in Medvidek movie

```
MATCH (m:MOVIE)-[r:PLAY]->(a:ACTOR)
WHERE m.title = "Medvidek"
RETURN a.name, a.year
ORDER BY a.year
```

a.name	a.year
Ivan Trojan	1964
Jiří Macháček	1966

Clauses

Read clauses and their sub-clauses

- MATCH specifies graph patterns to be searched for
 - WHERE adds additional filtering constraints
- ..

Write clauses and their sub-clauses

- CREATE creates new nodes or relationships
- DELETE deletes nodes or relationships
- SET updates labels or properties
- REMOVE removes labels or properties
- ..

Clauses

General clauses and their sub-clauses

- RETURN defines what the query result should contain
 - ORDER BY describes how the query result should be ordered
 - SKIP excludes certain number of solutions from the result
 - LIMIT limits the number of solutions to be included
- WITH allows query parts to be chained together
- ..

Path pattern expression

- Sequence of interleaved node and relationship patterns
- Describes a single <u>path</u> (not a general subgraph)

- ASCII-Art inspired syntax
 - Circles () for nodes
 - Arrows <--, --, --> for relationships

Node pattern

Matches one data node

- Variable
 - Allows us to access a given node later on
- Set of labels
 - Data node must have all the specified labels to be matched
- Property map
 - Data node must have all the requested properties (including their values) to be matched (the order is unimportant)

Property map

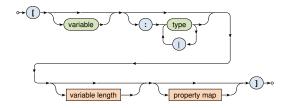

Relationship pattern

Matches one data relationship

Relationship pattern

- Variable
 - Allows us to access a given node later on
- Set of types
 - Data relationship must be of one of the enumerated types to be matched

Relationship pattern (cont.)

- Property map
 - Data relationship must have all the requested properties
- Variable path length
 - Allows us to match paths of arbitrary lengths (not just exactly one relationship)

• Examples: *, *4, *2...6, *...6, *2...

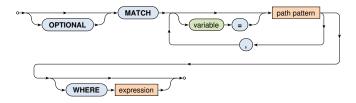

Examples

```
()
(x) - -(y)
(m:MOVIE)-->(a:ACTOR)
(:MOVIE)-->(a { name: "Ivan Trojan" })
()<-[r:PLAY]-()
(m)-[:PLAY { role: "Ivan" }]->()
(:ACTOR { name: "Ivan Trojan" })-[:KNOW *2]->(:ACTOR)
()-\Gamma: KNOW *5..]->(f)
```

Match Clause

MATCH clause

- Allows to search for sub-graphs of the data graph that match the provided path pattern / patterns (all of them)
 - Query result (table) = unordered set of solutions
 - One solution (row) = set of variable bindings
- Each variable has to be bound

Match Clause

WHERE sub-clause may provide additional constraints

- These constraints are evaluated directly during the matching phase (i.e. not after it)
- Typical usage
 - Boolean expressions
 - Comparisons
 - Path patterns true if at least one solution is found
 - ٠..

Match Clause: Example

Find names of actors who played with Ivan Trojan in any movie

```
MATCH (i:ACTOR)<-[:PLAY]-(m:MOVIE)-[:PLAY]->(a:ACTOR)
WHERE (i.name = "Ivan Trojan")
RETURN a.name
```

```
MATCH (i:ACTOR { name: "Ivan Trojan" })
          <-[:PLAY]-(m:MOVIE)-[:PLAY]->
          (a:ACTOR)
RETURN a.name
```

i	m	a
(a1)	(m2)	(a2)
(a1)	(m2)	(a3)
(a1)	(m3)	(a2)

Match Clause

Uniqueness requirement

 One data node may match several query nodes, but one data relationship may not match several query relationships

OPTIONAL MATCH

- Attempts to find matching data sub-graphs as usual...
- but when no solution is found, one specific solution with all the variables bound to NULL is generated
- Note that either the whole pattern is matched, or nothing is matched

Match Clause: Example

Find movies filmed in 2005 or earlier and names of their actors (if any)

```
MATCH (m:MOVIE)

WHERE (m.year <= 2005)

OPTIONAL MATCH (m)-[:PLAY]->(a:ACTOR)

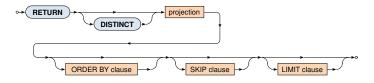

RETURN m.title, a.name
```

		m	а	
m		(m2)	(a1)	
(m2)	\Rightarrow	(m2)	(a2)	\Rightarrow
(m4)		(m2)	(a3)	
	1	(m4)	NULL	

m.title	a.name
Samotáři	Ivan Trojan
Samotáři	Jiří Macháček
Samotáři	Jitka Schneiderová
Štěstí	NULL

RETURN clause

- Defines what to include in the query result
 - Projection of variables, properties of nodes or relationships (via dot notation), aggregation functions, ...
- Optional ORDER BY, SKIP and LIMIT sub-clauses

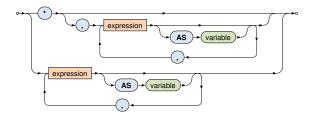

RETURN DISTINCT

Duplicate solutions (rows) are removed

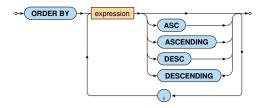

Projection

- * = all the variables
 - Can only be specified as the very first item
- AS allows to explicitly (re)name output records

ORDER BY sub-clause

- Defines the order of solutions within the query result
 - Multiple criteria can be specified
 - Default direction is ASC
- The order is undefined unless explicitly defined
- Nodes and relationships as such cannot be used as criteria

SKIP sub-clause

 Determines the number of solutions to be skipped in the query result

LIMIT sub-clause

 Determines the number of solutions to be included in the query result

With Clause

WITH clause

- Constructs intermediate result
 - Analogous behavior to the RETURN clause
 - Does not output anything to the user, just forwards the current result to the subsequent clause
- Optional WHERE sub-clause can also be provided

With Clause: Example

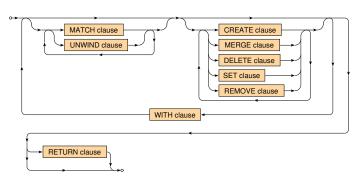

Numbers of movies in which actors born in 1965 or later played

```
MATCH (a:ACTOR)
WHERE (a.year >= 1965)
WITH a, SIZE( (a)<-[:PLAY]-(m:MOVIE) ) AS movies
RETURN a.name, movies
ORDER BY movies ASC
```

a		а	movies		a.name	movies
(a2)	\Rightarrow	(a2)	3	\Rightarrow	Jitka Schneiderová	1
(a3)		(a3)	1		Jiří Macháček	3

Query Structure

Chaining of Cypher clauses (*simplified*)

- Read clauses: MATCH, ...
- Write clauses: CREATE, DELETE, SET, REMOVE, ...

Query Structure

Query parts

- WITH clauses split the whole query into query parts
- Certain restrictions apply...
 - Read clauses (if any) must precede write clauses (if any) in every query part
 - The last query part must be terminated by a RETURN clause
 - Unless this part contains at least one write clause
 - I.e. read-only queries must return data

• ..

CREATE clause

Inserts new nodes or relationships into the data graph

Example

```
MATCH (m:MOVIE { id: "stesti"})

CREATE
(a:ACTOR { id: "vilhelmova", name: "Tatiana Vilhelmová", year: 1978}),
(m)-[:PLAY]->(a)
```

DELETE clause

- Removes nodes, relationships or paths from the data graph
- Relationships must always be removed before the nodes they are associated with
 - Unless the DETACH modifier is specified

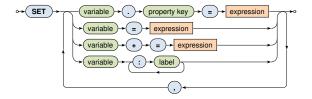

Example

```
MATCH (:MOVIE { id: "stesti"})-[r:PLAY]->(a:ACTOR)
DELETE r
```

SET clause

- Allows to...
 - set a value of a particular property
 - or remove a property when NULL is assigned
 - replace properties (all of them) with new ones
 - add new properties to the existing ones
 - add labels to nodes
- Cannot be used to set relationship types

REMOVE clause

- Allows to...
 - remove a particular property
 - remove labels from nodes
- Cannot be used to remove relationship types

Expressions

Literal expressions

- Integers: decimal, octal, hexadecimal
- Floating-point numbers
- Strings
 - Enclosed in double or single quotes
 - Standard escape sequences
- Boolean values: true, false
- NULL value (cannot be stored in data graphs)

Other expressions

 Collections, variables, property accessors, function calls, path patterns, boolean expressions, arithmetic expressions, comparisons, regular expressions, predicates, ...

Lecture Conclusion

Neo4j = graph database

- Property graphs
- Traversal framework
 - Path expanders, uniqueness, evaluators, traverser

Cypher = graph query language

- Read (sub-)clauses: MATCH, WHERE, ...
- Write (sub-)clauses: CREATE, DELETE, SET, REMOVE, ...
- General (sub-)clauses: RETURN, WITH, ORDER BY, LIMIT, ...
