

High Performance Software Development

Topics included

- ▶ Modern programming styles vs. performance
- ▶ Relevant properties of modern CPUs
 - ▶ ILP, SIMD
- ▶ Performance-tuning software
- ▶ Compiler optimization
- ▶ Memory hierarchy
 - ▶ Cache-Aware and Cache-Oblivious algorithms

Topics not included

Topics NOT included

- ▶ Programming in assembly languages
 - ▶ Compilers usually do it better
 - ▶ However, we will use vector instructions within C/C++
- ▶ Parallel programming
 - ▶ See NPRG042 Programming in Parallel Environment
 - ▶ Observation: Careful single-threaded implementation produces speed-up similar to average parallel implementation
- ▶ Code optimization by compilers
 - ▶ See NSWI109 Compiler Construction
 - ▶ Here we will talk about what the compilers do, not how
- ▶ Programming environments for clusters, grids, clouds, ...
 - ▶ They require some experience in parallelism and robustness

▶ Summer term

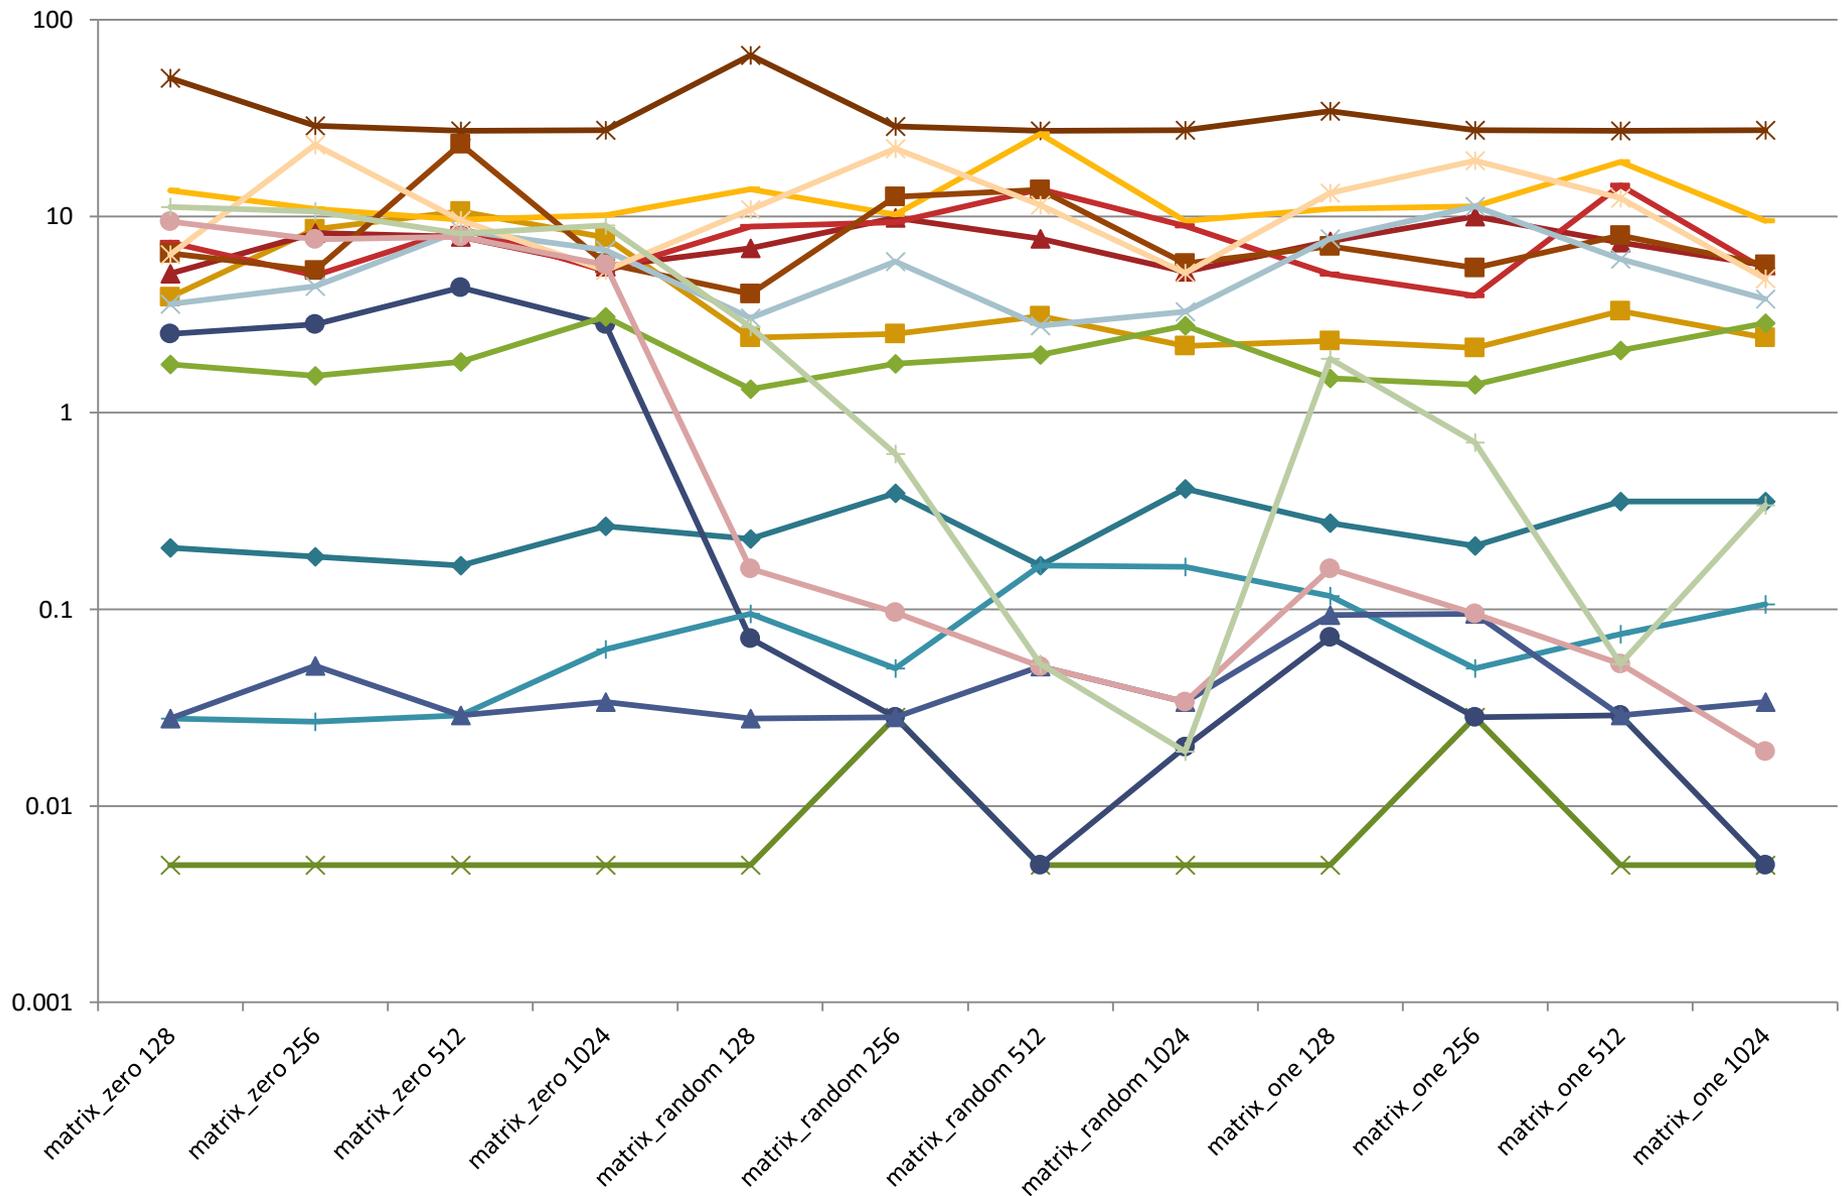

- ▶ Compiler Design - NSWI109
 - Code optimization by compilers
- ▶ Programming in Parallel Environment - NPRG042
- ▶ Performance Evaluation of Computer Systems - NSWI131
 - Including the technology behind profilers, related statistics
- ▶ Computer Architecture - NSWI143
 - Including more details on CPU internals and memory hierarchy
- ▶ Advanced C++ Programming - NPRG051
 - Including template metaprogramming
- ▶ Advanced Tools for Software Development and Monitoring - NSWI126
 - Selected tools, including profilers

▶ Winter term

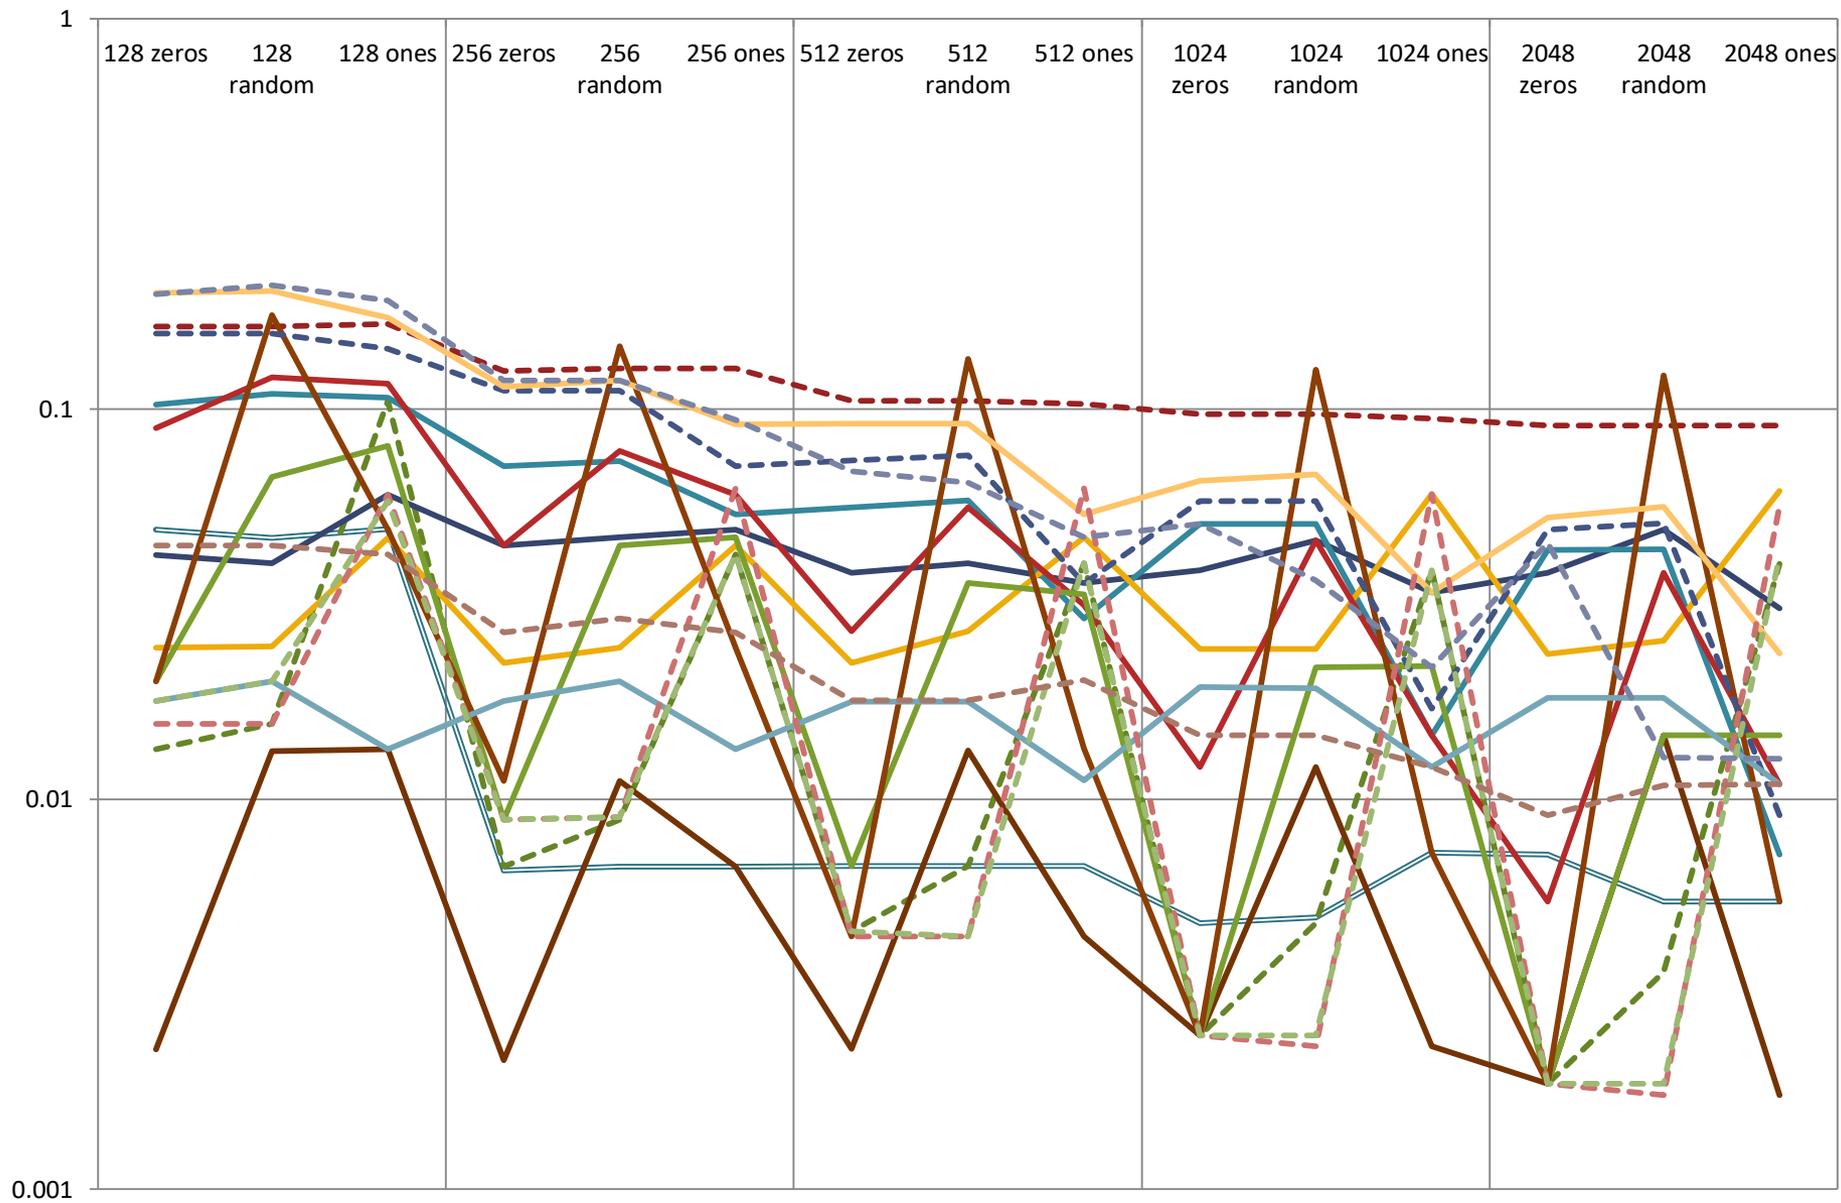

- ▶ Advanced Programming in Parallel Environment - NPRG058
- ▶ Principles of Distributed Systems - NSWI035
 - The theory behind parallel and distributed systems

Motivation

A homework (2012/2013) – students not instructed to optimize speed

The same homework– students motivated to optimize speed

Real performance of sorting algorithms
