This unit is based on the book chapter "Chain Folding" from the O'Reilly book "MapReduce Design Patterns" by Donald Miner and Adam Shook.

1. The book mentions a number of patterns for chain folding. One says: If multiple Map phases are adjacent, merge them into one phase.

Complete the following sketches of how this pattern may be applied:

2. Another pattern says: If a job ends with a Map phase (combined or otherwise), push that phase into the Reducer right before it. Complete the following sketch of how this pattern may be applied:

3. What are the benefits of applying these patterns?

4. We consider the following SQL query.

SELECT DISTINCT p.name FROM Eats e, Person p WHERE e.name = p.name AND p.age <= 18

We assume that the following input file Person.txt resides in HDFS:

```
Person {"Person.name": "Amy", "Person.age": 16, "Person.gender": "female"}
Person {"Person.name": "Ben", "Person.age": 21, "Person.gender": "male"}
Person {"Person.name": "Cal", "Person.age": 33, "Person.gender": "male"}
Person {"Person.name": "Dan", "Person.age": 13, "Person.gender": "male"}
Person {"Person.name": "Eli", "Person.age": 45, "Person.gender": "male"}
Person {"Person.name": "Fay", "Person.age": 21, "Person.gender": "female"}
Person {"Person.name": "Gus", "Person.age": 24, "Person.gender": "male"}
Person {"Person.name": "Hil", "Person.age": 30, "Person.gender": "male"}
Person {"Person.name": "Hil", "Person.age": 30, "Person.gender": "male"}
```

Further, there is the file Eats.txt:

<pre>Eats {"Eats.name": "Amy", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Ben", "Eats.pizza": "cheese"} Eats {"Eats.name": "Ben", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Cal", "Eats.pizza": "supreme"} Eats {"Eats.name": "Dan", "Eats.pizza": "cheese"} Eats {"Eats.name": "Dan", "Eats.pizza": "mushroom"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}</pre>
Eats {"Eats.name": "Ben", "Eats.pizza": "cheese"} Eats {"Eats.name": "Ben", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Cal", "Eats.pizza": "supreme"} Eats {"Eats.name": "Dan", "Eats.pizza": "cheese"} Eats {"Eats.name": "Dan", "Eats.pizza": "mushroom"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
Eats {"Eats.name": "Ben", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Cal", "Eats.pizza": "supreme"} Eats {"Eats.name": "Dan", "Eats.pizza": "cheese"} Eats {"Eats.name": "Dan", "Eats.pizza": "mushroom"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
Eats {"Eats.name": "Cal", "Eats.pizza": "supreme"} Eats {"Eats.name": "Dan", "Eats.pizza": "cheese"} Eats {"Eats.name": "Dan", "Eats.pizza": "mushroom"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
Eats {"Eats.name": "Dan", "Eats.pizza": "cheese"} Eats {"Eats.name": "Dan", "Eats.pizza": "mushroom"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
Eats {"Eats.name": "Dan", "Eats.pizza": "mushroom"} Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
Eats {"Eats.name": "Dan", "Eats.pizza": "pepperoni"} Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
Eats {"Eats.name": "Dan", "Eats.pizza": "sausage"}
<pre>Eats {"Eats.name": "Dan", "Eats.pizza": "supreme"}</pre>
<pre>Eats {"Eats.name": "Eli", "Eats.pizza": "cheese"}</pre>
<pre>Eats {"Eats.name": "Eli", "Eats.pizza": "supreme"}</pre>
Eats {"Eats.name": "Fay", "Eats.pizza": "mushroom"}
<pre>Eats {"Eats.name": "Gus", "Eats.pizza": "cheese"}</pre>
Eats {"Eats.name": "Gus", "Eats.pizza": "mushroom"}
<pre>Eats {"Eats.name": "Gus", "Eats.pizza": "supreme"}</pre>
Eats {"Eats.name": "Hil", "Eats.pizza": "cheese"}
Eats {"Eats.name": "Hil", "Eats.pizza": "supreme"}
Eats {"Eats.name": "Ian", "Eats.pizza": "pepperoni"}
Eats {"Eats.name": "Ian", "Eats.pizza": "supreme"}

Perform the following steps:

- 1. Canonical translation into relational algebra, just like in Milestone 1.
- 2. Logical optimization, just like in Milestone 2: Selection pushing and joins.
- 3. Translation into a physical query plan with MapReduce-based operators, like in Milestone 3. Use the graphical notation familiar from questions 1 and 2 above.
- 4. Chain folding according to the patterns discussed earlier.
- 5. Compare the number of tuples written into HDFS when evaluating the physical query plans before and after chain folding. Discuss *briefly*.
- 6. Can the physical plan be folded any further?
- 5. We consider the following SQL query:

```
SELECT *
FROM (SELECT gender, age, count(*) as count
        FROM Person
        GROUP BY gender, age) T
WHERE T.count > 1
```

Perform the same steps as in the exercise before.
