Data Visualization

<https://www.ksi.mff.cuni.cz/~holubova/NDBI048/>

CRISP-DM Phases

- I. Business Understanding
- II. Data Understanding
- III. Data Preparation
- IV. Modeling
- V. Evaluation
- VI. Deployment

What is data exploration?

- A preliminary exploration of the data to better understand its characteristics
- Key motivations:
 - Helping to **select the right tool** for pre-processing or analysis
 - Making **use of humans' abilities** to recognize patterns
 - People can recognize patterns not captured by data analysis tools

Basic questions for data exploration

- Is the data organized or not?
- What does each record represent?
 - Record = row, document, triple, ...
- What does each attribute represent?
 - Attribute = column, field, property, ...
- Are there any missing data points?
- Do we need to perform any transformations on the columns?

There are other models /
formats, not just relational

"One picture is worth ten thousand words."
Chinese proverb

BASIC Techniques

- **Descriptive statistics**

- Numbers that summarize properties of the data
 - Frequency, mean, standard deviation, ...
- Most can be calculated in a single pass through the data

- **Visualization**

- Conversion of data into a visual format → characteristics of the data and the relationships among data items or attributes can be analysed / reported
 - Data objects, their attributes, and the relationships among data objects → points, lines, shapes, colours, ...
- One of the most powerful techniques for data exploration
- Humans have a well developed ability to analyse large amounts of information that is presented visually
 - Can detect general patterns and trends, outliers and unusual patterns

Motivation for Data Visualization

- **Data visualization** = creation and studying of visual representation of data
 - Information abstracted in some schematic form
 - Including attributes, variables, ...
- Purpose:
 - To communicate information clearly and effectively through graphical means
 - To help find the information needed more effectively and intuitively
- Both **aesthetic form** and **functionality** are required
- Even when data volumes are large, the patterns can be spotted quite easily (with the right data processing and visualization)
 - Simplification of Big Data management
 - Picking up things with the naked eye that would otherwise be hidden

Motivation

Similar motivation as for statistics but visualization can reveal / distinguish data/trends/patters, ... which statistics can not (easily)

21	2000	1.5571
22	2001	1.56235
23	2002	1.58847
24	2003	1.59309
25	2004	1.58303
26	2005	1.5947

Find an outlier....

Data Visualization

- Information visualization has two equally important aspects
 - **Structural modeling**
 - Detection, extraction and simplification of the underlying information
 - **Graphical representation**
 - Transform initial representation into a graphical one which provides visualization of the structure
 - Different types of structures require different type of visualization
 - e.g., time series vs. hierarchical information

Exploratory vs. Explanatory visualization

Exploratory

- What the data is
- What is hidden in the data
- Enables to look at the data from different angles

Explanatory

- Helping to make sense of the data by choosing the right technique
- Needs to know the context from which the user come and what they need to know
- Strategic placement of elements and choice of attributes to help the users to focus on what is important

Big Data Visualization

- Decision about what technique to use became more difficult with Big Data
 - Visualization is needed to decide **which portion of data** to explore further
 - Visualization algorithms (i.e., graph drawing) should **scale well** to billions of entities (nodes)
 - The first application was probably the visualization of web-related data
 - i.e., pages, relations, traffic, ...
 - **New techniques** may be needed
 - Trends might not be clear
 - Noise reduction might be even more necessary

Challenges of Data visualization

- Determine the medium
 - Table – individual precise values, comparison of individual values, multiple levels of aggregation, ...
 - Graph – pattern trends and exceptions, a set of values is seen as whole, ...
 - Schema
- Design the components of the medium
 - Which data to emphasize, which colors to choose, ...

Visualization Type

Data Relationships

- Scatter plot

- Classical statistical diagram that lets us visualize relationships between numeric variables
- Can carry additional information
 - Color, shape, size, ...

- Matrix chart

- Summarizes a multidimensional data set in a grid

- Network diagram

- A set of objects (vertices) connected by edges
- Visualization of the network is optimized to keep strongly related items in close proximity to each other

Visualization Types

Data Relationships

- (Scatter) plot matrix
 - Matrix of scatter (or other) plots
 - Each scatter plot is created between different combinations of variables

distribution of data for the variable in the column

Iris data set

2000: State-level support (orange) or opposition (green) on school vouchers, relative to the national average of 45% support

Orange and green colors correspond to states where support for vouchers was greater or less than the national average. The seven ethnic/religious categories are mutually exclusive. "Evangelicals" includes Mormons as well as born-again Protestants. Where a category represents less than 1% of the voters of a state, the state is left blank.

2008-2009 season

Visualization Types

Data Relationships

- Correlation matrix (**heat map**)
 - Combines data to quickly identify which variables are related
 - Shows how strong the relationship is between the variables

Visualization Types

Data Relationships

- Heat map is often combined with a **dendrogram**
 - Aggregates rows or columns based on their overall similarity into a tree structure

Visualization Types

Comparison of a Set of Values

Bar Chart

- Classical method for numerical comparisons
- Histograms

Box plot (box-and-whisker plots)

- Five statistics (minimum, lower quartile, median, upper quartile and maximum) summarizing the distribution of a set of data

Bubble chart

- Circles in a bubble chart represent different data values
- Triplet (v_1, v_2, v_3) of data = bubble
 - Two of the v_i values = xy location
 - Third = size

Top 10 Films by Worldwide Grosses

From www.boxofficemojo.com

Visualization Types

Trends over Time

- **Line graph**
 - Classical method for visualizing continuous change
- **Stack graph**
 - Visualizing change in a set of items
 - The sum of the values is as important as the individual items

Visualization Types

Parts of a Whole

■ Pie Chart

- Percentages are encoded as "slices" of a pie, with the area corresponding to the percentage

■ Treemap

- Visualization of hierarchical structures
- Effective in showing attributes of leaf nodes using size and color coding
- Enable to compare nodes and sub-trees at varying depth

Economy of Australia

Visualization Types

Text Analysis

- Tag cloud
 - Visualization of word frequencies
 - i.e., how frequently words appear in a given text

Which Visualization Technique to Use?

- New visualization software is capable of “guessing” the correct visualization based on the characteristics of the data
 - One-dimensional data $\Rightarrow$ bar chart
 - Two-dimensional data $\Rightarrow$ scatter plot
 - N-dimensional data $\Rightarrow$ multiple scatter plots, matrix chart, ...
 - Data with coordinates $\Rightarrow$ map-based charts
- Offers options
- Trend: to simplify the process for common users

Big Data Visualization

- The goal of visualizing Big Data is usually to make sense of a large amount of interlinked information
- In interconnected data the connections between objects are difficult to organize on a linear layout
 - **Circular representations**
 - **Network diagrams**
- Typical “topologies” one can encounter (a bit confusing term based on Manuel Lima’s “Visual Complexity” – see references) include **arc diagrams, centralized burst, centralized ring, globe, circular ties** or **radial convergence**
 - And many more...

Arc Diagram

- Vertices are placed on a line and edges are drawn as semicircles
- Arcs represent relationships
 - Colors can encode, e.g., distance

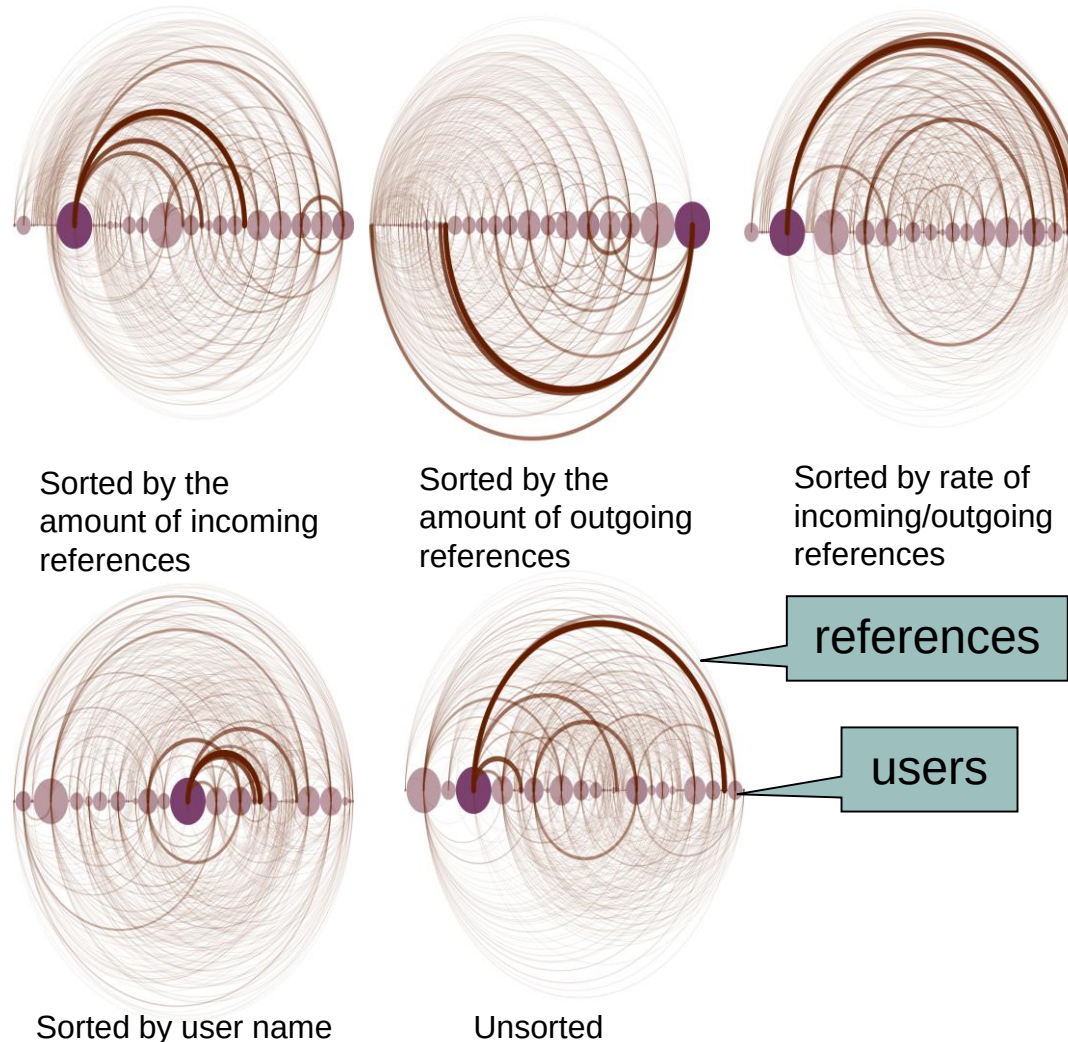

A map of 63,799 cross-references found in the Bible. The bottom bars represent number of verses in the given chapter. Color of arcs represents the distance between the two chapters.

<http://www.chrisharrison.net/index.php/Visualizations/BibleViz>

Arc Diagram

- Visualization of IRC communication behavior: Who is namedropping whom?
 - Arcs are directional and drawn clockwise:
 - In the upper half of a graph they point from left to right, in the bottom half from right to left
 - Reference is a message from a user containing the name of another user
 - Arc strength corresponds to the number of references from the source to the target
 - Circle size = Number of messages
 - Circle color = Average message length
- This visualization favors strong social connections over sociability: Frequent references between the same two users feature more prominently than combined references from several sources to a single target.

http://datavis.dekstop.de/irc_arcs/

Centralized Burst

Paieck

- Visualization with strong central tendency
- Can reveal highly connected objects (hubs) which usually correspond to objects with high importance
 - e.g., in a gene network, hubs are interesting points for targeting new drugs
 - Disabling a central gene probably will not allow the organism to adapt

A map of [protein-to-protein interactions of a yeast](#)

source: H. Jeong. et al. "Lethality and Centrality in Protein Networks",
Nature, no. 411, 2011: 41-42

Globe

- Globe visualizations are basically projections of other topologies on a globe

- The global exchange of information in real time by visualizing volumes of long distance telephone and IP data flowing between New York and cities around the world.
- How does the city of New York connect to other cities? With which cities does New York have the strongest ties and how do these relationships shift with time? How does the rest of the world reach into the neighborhoods of New York? The size of the glow on a particular city location corresponds to the amount of IP traffic flowing between that place and New York City. A greater glow implies a greater IP flow.

<http://www.aaronkoblin.com/work/NYTE/index.html>

Radial Convergence

- Also known as **radial chart**
- Actually a 360 arc diagram

Tracking the commercial ties between most countries across the globe.

<http://cephea.de/gde/>

Money flow from private donators to parties in the German Bundestag (house of the parliament).

Graph Drawing

- **Spatial layout** and **graph drawing** play a key aspect in information visualization
- Good layout needs to express the key features of a complex structure
- Graph drawing algorithms first agree on a criterion of what makes a good graph (and what should be avoided) and then run an algorithm driven by these criteria
- Generally, the primary goal is to optimize the arrangement of nodes so that **strongly connected nodes appear close to each other**
 - Most widely known graph drawing algorithms combine **force-directed** graph drawing and **spring-embedder** algorithms
 - The strength of a connection needs to be defined

Force-Directed Placement

- Can be traced back to VLSI (very large scale integration) design = creating integrated circuits
 - Aim: optimize the layout of a circuit to obtain **as few number of crossings as possible**
- Generally agreed on **aesthetics criteria**
 - **Symmetry**
 - **Even distribution of nodes**
 - **Uniform edge lengths**
 - **Minimization of edge crossings**
- Some of the criteria can be mutually exclusive
 - e.g., symmetric graph may require crossings which might be avoided

The facebook network represented with a force-directed placement algorithm. Colors represent the clusters on the map and selected nodes used to train the map are represented by squares (instead of circles)

https://www.researchgate.net/figure/The-facebook-c-network-represented-with-a-force-directed-placement-algorithm-22-Colors_fig2_281597675

Force-Directed placement

- Replaces vertices in a graph by steel rings and edges by springs
 - Attractive force is applied to a pair of connected nodes
 - Spring-like forces (Hook's law)
 - Repulsive force is applied to a pair of disconnected nodes
 - Forces of electrically charged particles (Coulomb's law)
- **Equilibrium state for the system of forces:**
 - Edges tend to have uniform length (spring forces)
 - Nodes that are not connected by an edge tend to be drawn further apart (electrical repulsion)

Graph Drawing Challenges

- Current algorithms are inefficient in **incremental updating** of the layout
 - i.e., one needs to redraw the whole layout when adding/removing a single node
- Networks with **heterogeneous link types** or node types cannot be efficiently handled
 - e.g., having users of a social network sharing various type of content (images, posts, video) and forming various types of relations (liking, tagging)
- Majority of **algorithms focus on strong ties** (heavyweight links)
 - Weak ties can be surprisingly valuable because they are more likely to be the source of novel information
 - e.g., hearing about a new job offering is an example of weak link with great social impact

Graph Drawing Challenge

- **Scalability**

- Big Data related challenge
- Problematic scaling as the size and density of the network increases
 - i.e., Big Data are also difficult to visualize

- **Limited screen resolution**

- Big Data related challenge
- Sometimes we simply do not have enough pixels to visualize a complex large-scale network
 - Zoomable interfaces, fish-eye views, ...
 - In general solvable by interactivity

Graph Drawing Challenges

Scalability

- Solution with dense or large-scale networks can be partially solved by **reducing the complexity of the information** to be visualized
- **Link reduction techniques**
 - E.g. removing low-weight links, minimum spanning tree, ...
- **Clustering**
 - Dividing the network into smaller components and treat them individually
- **Dimension reduction**
 - Idea: each **data point** consists of **multiple attributes** and the goal is to visualize **similar data points near to each other** in 2D space = **projection** from a multidimensional space **into a 2D space**
 - Generally difficult problem
 - Distance space is not metric

Data Visualization Tools

- Analytics and visualization tools
 - Standard statistical packages
 - R, Matlab
 - Customizability according to specific needs
 - Libraries for data visualization
 - Python - Matplotlib, Pandas, Seaborn,...
 - Specialized data analytics/visualization solutions
 - [SAS](#), [IBM Cognos](#)
 - Limited by the design
 - Ready-to-use solutions on top of a data warehouse
- Visualization tools
 - [Tableau](#), [Many Eyes](#) (IBM), [Circos](#), [Visual.ly](#)
- Trend: to bring the visualization and analysis to common users (not only data scientists)
 - Easy-to-use software
 - Web interfaces allowing instant sharing of visualizations
 - Drag and drop interfaces
