Riak Overview

RiakKV

- Highly available distributed key-value store
- http://basho.com/products/riak-kv/

Data model

```
\mathsf{Instance} \ (\to \mathsf{bucket} \ \mathsf{types}) \to \mathsf{buckets} \to \mathsf{objects}
```

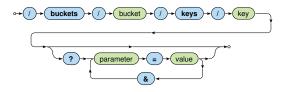

- Bucket = logical collection of objects
- Object = key-value pair with metadata
 - Key is a Unicode string, unique within a bucket
 - Value can be anything (text, binary object, image, ...)
 - Each object is also associated with metadata

CRUD Operations

HTTP API

 All the user requests are submitted as HTTP requests with appropriately selected / constructed methods, URLs, headers, and data

URL pattern of HTTP requests for all the CRUD operations

Optional parameters (depending on the operation)

CRUD Operations

Basic operations on objects

- <u>Create</u>: POST or PUT methods
 - Inserts a key-value pair into a given bucket
 - Key is specified manually, or will be generated automatically
- Read: GET method
 - Retrieves a key-value pair from a given bucket
- Update: PUT method
 - Updates a key-value pair in a given bucket
- <u>D</u>elete: DELETE method
 - Removes a key-value pair from a given bucket

HTTP API

cURL tool

 Allows to transfer data from / to a server using HTTP (or other supported protocols)

Options

- -X command, --request command
 - HTTP request method to be used (GET, ...)
- -d data, --data data
 - Data to be sent to the server (implies the POST method)
- -H header, --header header
 - Extra headers to be included when sending the request
- -i, --include
 - Prints both headers and (not just) body of a response

First Steps

Remotely connect to our NoSQL server

- SSH and SFTP access
- PuTTY and WinSCP on Windows
- nosql.ms.mff.cuni.cz:42222

Check Riak cluster status

- curl -v http://localhost:10011/ping
- And with higher permissions...
 - riak ping
 - riak-admin test
 - riak-admin status
 - riak-admin status | grep ring_members

Read and Write Operations

Insert object for a new actor

Prefix all the bucket names with your login

```
curl -i -X PUT
  -H 'Content-Type: text/plain'
  -d 'Ivan Trojan, 1964'
  http://localhost:10011/buckets/login_actors/keys/trojan
```

Retrieve the previously inserted actor

Examine both response body and headers

```
curl -i -X GET
http://localhost:10011/buckets/login_actors/keys/trojan
```

Bucket Operations

List all the buckets

Only buckets with at least one object will be included

```
curl -i -X GET
http://localhost:10011/buckets?buckets=true
```

List all the keys in the bucket of actors

Note that this operation cannot be executed efficiently

```
curl -i -X GET
http://localhost:10011/buckets/login_actors/keys?keys=true
```

Update and Delete Operations

Update our actor object

```
curl -i -X PUT
-H 'Content-Type: application/json'
-d '{ "name" : "Ivan Trojan", "year" : 1964 }'
http://localhost:10011/buckets/login_actors/keys/trojan
```

Check the updated actor object

- Use different virtual nodes as well
- localhost:10011, localhost:10012, localhost:10013

Remove the actor object

```
curl -i -X DELETE
http://localhost:10011/buckets/login_actors/keys/trojan
```

Sample Data

Insert objects for new actors

- Put the data into login_actors bucket
- Use application/json content type

```
{ "name" : "Ivan Trojan", "year" : 1964 }

{ "name" : "Jiří Macháček", "year" : 1966 }

{ "name" : "Jitka Schneiderová", "year" : 1973 }

{ "name" : "Zdeněk Svěrák", "year" : 1936 }
```

Sample Data

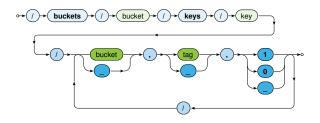

Insert objects for new movies

- Put the data into login_movies bucket
- Use application/json content type once again

```
"title": "Vratné lahve", "year": 2006,
"actors" : [ "Zdeněk Svěrák", "Jiří Macháček" ]
"title": "Samotáři", "year": 2000,
"actors" : [ "Jitka Schneiderová", "Ivan Trojan", "Jiří Macháček" ]
"title": "Medvidek", "year": 2007,
"actors" : [ "Jiří Macháček", "Ivan Trojan" ]
```

Links and Link Walking

Links = directed relationships between objects

Parameters

- Bucket assumes only a given target bucket
- Tag considers only a given link tag
- Keep whether the objects should be included in the result

Links and Link Walking

Create new links actor → movie

```
curl -i -X PUT

-H 'Content-Type: application/json'

-H 'Link: </buckets/login_movies/keys/samotari>; riaktag="tmovie"'

-H 'Link: </buckets/login_movies/keys/medvidek>; riaktag="tmovie"'

-d '{ "name" : "Ivan Trojan", "year" : 1964 }'

http://localhost:10011/buckets/login_actors/keys/trojan
```

Check the updated actor object

Verify the presence of links in particular

Traverse the links from the actor

```
curl -i -X GET
  http://localhost:10011/buckets/login_actors/keys/trojan
  /login_movies,tmovie,1
```

Links and Link Walking

Add all the links movie \rightarrow actor

Express a more complicated link walking query

Find all the actors that appeared in movies where Trojan stared

Search 2.0: Yokozuna

Create a full-text index for the bucket of actors

```
curl -i -X PUT
  -H 'Content-Type: application/json'
  -d '{ "schema" : "_yz_default" }'
  http://localhost:10011/search/index/login_iactors

curl -i -X PUT
  -H 'Content-Type: application/json'
  -d '{ "props" : { "search_index" : "login_iactors" } }'
  http://localhost:10011/buckets/login_actors/props
```

Verify the new bucket properties

```
curl -i -X GET
  http://localhost:10011/buckets/login_actors/props
```

Search 2.0: Yokozuna

Reinsert objects for all the actors

- Note that names of fields were changed...
 - Suffixes recognizable by the JSON extractor were added
 - Czech accented characters were removed

```
{ "name_s" : "Ivan Trojan", "year_i" : 1964 }

{ "name_s" : "Jiri Machacek", "year_i" : 1966 }

{ "name_s" : "Jitka Schneiderova", "year_i" : 1973 }

{ "name_s" : "Zdenek Sverak", "year_i" : 1936 }
```

Search 2.0: Yokozuna

Find all the actors born in 1964

```
curl -i -X GET
  'http://localhost:10011/search/query/
   login_iactors?wt=json&omitHeader=true&q=year_i:1964'
```

Express a more complicated full-text query

 Find all the actors who were born in 1960 or later and their name contains substring de
