

NDBI040: Modern Database Concepts

<http://www.ksi.mff.cuni.cz/~svoboda/courses/191-NDBI040/>

Lecture 1

Introduction

Martin Svoboda

svoboda@ksi.mff.cuni.cz

1. 10. 2019

Charles University, Faculty of Mathematics and Physics

Lecture Outline

Big Data

- Characteristics
- Current trends

NoSQL databases

- Motivation
- Features

Overview of NoSQL database types

- **Key-value, wide column, document, graph, ...**

What is Big Data?

Buzzword? Bubble? Gold rush? Revolution?

Dan Ariely:

Big Data is like teenage sex: **everyone** talks about it, **nobody** really knows how to do it, **everyone** thinks everyone else is doing it, so **everyone** claims they are doing it.

What is Big Data?

No standard definition

- Gartner (*research and advisory company*):
High Performance Computing

Big Data is **high volume**, **high velocity**, and/or **high variety** information assets that require **new forms of processing** to enable enhanced decision making, insight discovery and process optimization.

Where is Big Data?

Sources of Big Data

- **Social media and networks**
 - ...all of us are generating data
- **Scientific instruments**
 - ...collecting all sorts of data
- **Mobile devices**
 - ...tracking all objects all the time
- **Sensor technology and networks**
 - ...measuring all kinds of data

Big Data Characteristics

Volume (Scale)

Source: <http://www.ibmbigdatahub.com/>

Big Data Characteristics

Variety (Complexity)

Source: <http://www.ibmbigdatahub.com/>

Big Data Characteristics

Velocity (Speed)

The New York Stock Exchange captures
1 TB OF TRADE INFORMATION
during each trading session

By 2016, it is projected
there will be

**18.9 BILLION
NETWORK
CONNECTIONS**

— almost 2.5 connections
per person on earth

Modern cars have close to
100 SENSORS
that monitor items such as
fuel level and tire pressure

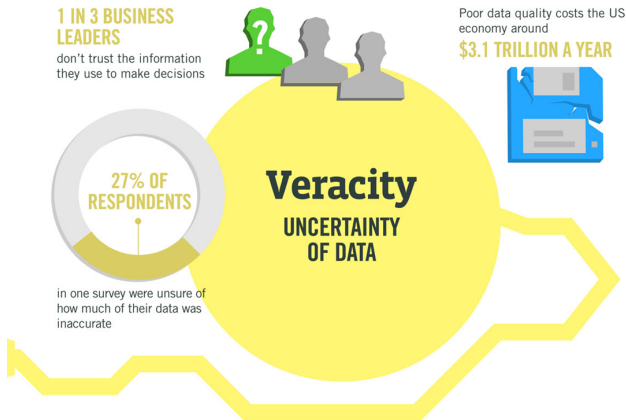

Velocity
ANALYSIS OF
STREAMING DATA

Source: <http://www.ibmbigdatahub.com/>

Big Data Characteristics

Veracity (Uncertainty)

Source: <http://www.ibmbigdatahub.com/>

Big Data Characteristics

Basic 4V

- **Volume** (Scale)
 - Data volume is increasing exponentially, not linearly
 - Even large amounts of small data can result into Big Data
- **Variety** (Complexity)
 - Various formats, types, and structures
(from semi-structured XML to unstructured multimedia)
- **Velocity** (Speed)
 - Data is being generated fast and needs to be processed fast
- **Veracity** (Uncertainty)
 - Uncertainty due to inconsistency, incompleteness, latency, ambiguities, or approximations

Big Data Characteristics

Additional V and C

- Value
 - Business value of the data (needs to be revealed)
- Validity
 - Data correctness and accuracy with respect to the intended use
- Volatility
 - Period of time the data is valid and should be maintained
- Cardinality
- Continuity
- Complexity

Big Data Characteristics

Additional V

Relational Databases

Data model

Instance \rightarrow **database** \rightarrow **table** \rightarrow **row**

Query languages

- Real-world: **SQL** (*Structured Query Language*)
- Formal: **Relational algebra**, relational calculi (domain, tuple)

Query patterns

- **Selection** based on complex conditions, **projection**, **joins**, **aggregation**, derivation of new values, recursive queries, ...

Representatives

- Oracle Database, Microsoft SQL Server, IBM DB2
- MySQL, PostgreSQL

Relational Databases

Representatives

Relational Databases

Features: Normal Forms

Model

- Functional dependencies
- 1NF, 2NF, 3NF, BCNF (Boyce-Codd normal form)

Objective

- **Normalization of database schema** to BCNF or 3NF
- Algorithms: decomposition or synthesis

Motivation

- Diminish **data redundancy**, prevent update anomalies
- However:
 - Data is scattered into small pieces (high granularity), and so
 - these pieces have to be joined back together when querying!

Relational Databases

Features: Transactions

Model

- **Transaction** = flat sequence of database operations (READ, WRITE, COMMIT, ABORT)

Objectives

- Enforcement of ACID properties
- **Efficient parallel / concurrent execution** (slow hard drives, ...)

ACID properties

- Atomicity – partial execution is not allowed (all or nothing)
- Consistency – transactions turn one valid database state into another
- Isolation – uncommitted effects are concealed among transactions
- Durability – effects of committed transactions are permanent

Current Trends

Big Data

- **Volume:** terabytes → zettabytes
- **Variety:** structured → structured and unstructured data
- **Velocity:** batch processing → streaming data
- ...

Big users

- Population online, hours spent online, devices online, ...
- Rapidly growing companies / web applications
 - Even millions of users within a few months

Current Trends

Everything is in **cloud**

- **SaaS**: Software as a Service
- **PaaS**: Platform as a Service
- **IaaS**: Infrastructure as a Service

Processing paradigms

- **OLTP**: Online Transaction Processing
- **OLAP**: Online Analytical Processing
- *...but also...*
- **RTAP**: Real-Time Analytical Processing

Current Trends

Data assumptions

- **Data format** is becoming unknown or inconsistent
- Linear growth → **unpredictable exponential growth**
- **Read requests** often prevail **write requests**
- Data updates are no longer frequent
- Data is expected to be replaced
- Strong **consistency** is no longer mission-critical

Current Trends

⇒ **New approach is required**

- Relational databases simply do not follow the current trends

Key technologies

- Distributed **file systems**
- **MapReduce** and other programming models
- Grid computing, cloud computing
- **NoSQL databases**
- Data warehouses
- Large scale machine learning

NoSQL Databases

What does **NoSQL** actually mean?

A bit of history ...

- 1998
 - First used for a relational database that omitted usage of SQL
- 2009
 - First used during a conference to advocate non-relational databases

So?

- Not: *no to SQL*
- Not: *not only SQL*
- NoSQL is an **accidental term with no precise definition**

NoSQL Databases

What does **NoSQL** actually mean?

NoSQL movement = The whole point of **seeking alternatives** is that you need to solve a problem that **relational databases are a bad fit for**

NoSQL databases = Next generation databases mostly addressing some of the points: being **non-relational, distributed, open-source** and **horizontally scalable**. The original intention has been modern web-scale databases. Often more characteristics apply as: **schema-free, easy replication support, simple API, eventually consistent, a huge data amount, and more.**

Source: <http://nosql-database.org/>

Types of NoSQL Databases

Core types

- **Key-value** stores
- **Wide column** (column family, column oriented, ...) stores
- **Document** stores
- **Graph** databases

Non-core types

- **Object** databases
- Native **XML** databases
- **RDF** stores
- ...

Key-Value Stores

Data model

- The most simple NoSQL database type
 - Works as a simple hash table (mapping)
- **Key-value pairs**
 - **Key** (id, identifier, primary key)
 - **Value**: binary object, black box for the database system

Query patterns

- Create, update or remove value for a given key
- **Get value** for a given key

Characteristics

- Simple model \Rightarrow **great performance, easily scaled, ...**
- Simple model \Rightarrow **not for complex queries nor complex data**

Key-Value Stores

Suitable use cases

- Session data, user profiles, user preferences, shopping carts, ...
 - I.e. **when values are only accessed via keys**

When not to use

- **Relationships among entities**
- Queries requiring **access to the content of the value part**
- **Set operations** involving multiple key-value pairs

Representatives

- Redis, **MemcachedDB**, **Riak KV**, Hazelcast, Ehcache, Amazon SimpleDB, Berkeley DB, Oracle NoSQL, Infinispan, LevelDB, Ignite, Project Voldemort
- *Multi-model*: OrientDB, ArangoDB

Key-Value Stores

Representatives

redis

hazelcast

EH*CACHE*

◁EROSPIKE

SimpleDB

ArangoDB

Document Stores

Data model

- **Documents**
 - Self-describing
 - **Hierarchical tree structures** (JSON, XML, ...)
 - Scalar values, maps, lists, sets, nested documents, ...
 - Identified by a **unique identifier** (key, ...)
- Documents are **organized into collections**

Query patterns

- Create, update or remove a document
- **Retrieve documents according to complex query conditions**

Observation

- Extended key-value stores where the value part is examinable!

Document Stores

Suitable use cases

- Event logging, content management systems, blogs, web analytics, e-commerce applications, ...
 - I.e. **for structured documents with similar schema**

When not to use

- **Set operations** involving multiple documents
- Design of document structure is constantly changing
 - I.e. when the required level of granularity would outbalance the advantages of aggregates

Document Stores

Representatives

- **MongoDB, Couchbase**, Amazon **DynamoDB**, **CouchDB**, RethinkDB, RavenDB, Terrastore
- *Multi-model*: **MarkLogic**, **OrientDB**, OpenLink Virtuoso, ArangoDB

Document Stores

Representatives

Wide Column Stores

Data model

- **Column family** (table)
 - Table is a collection of **similar rows** (not necessarily identical)
- **Row**
 - Row is a collection of **columns**
 - Should encompass a group of data that is accessed together
 - Associated with a unique **row key**
- **Column**
 - Column consists of a **column name** and **column value** (and possibly other metadata records)
 - Scalar values, but also **flat sets, lists or maps** may be allowed

Wide Column Stores

Query patterns

- Create, update or remove a row within a given column family
- **Select rows according to a row key or simple conditions**

Warning

- Wide column stores are not just a special kind of RDBMSs with a variable set of columns!

Wide Column Stores

Suitable use cases

- Event logging, content management systems, blogs, ...
 - I.e. for **structured flat data with similar schema**

When not to use

- **ACID transactions** are required
- **Complex queries**: aggregation (SUM, AVG, ...), joining, ...
- Early prototypes: i.e. when **database design may change**

Representatives

- Apache **Cassandra**, Apache **HBase**, Apache Accumulo, Hypertable, **Google Bigtable**

Wide Column Stores

Representatives

Graph Databases

Data model

- **Property graphs**
 - **Directed / undirected graphs**, i.e. collections of ...
 - **nodes** (vertices) for real-world entities, and
 - **relationships** (edges) between these nodes
 - Both the nodes and relationships can be associated with additional **properties**

Types of databases

- **Non-transactional** = small number of very large graphs
- **Transactional** = large number of small graphs

Graph Databases

Query patterns

- Create, update or remove a node / relationship in a graph
- **Graph algorithms** (shortest paths, spanning trees, ...)
- General **graph traversals**
- **Sub-graph** queries or **super-graph** queries
- Similarity based queries (approximate matching)

Representatives

- **Neo4j**, **Titan**, Apache Giraph, InfiniteGraph, FlockDB
- *Multi-model*: **OrientDB**, OpenLink **Virtuoso**, **ArangoDB**

Graph Databases

Suitable use cases

- Social networks, routing, dispatch, and location-based services, recommendation engines, chemical compounds, biological pathways, linguistic trees, ...
 - I.e. simply **for graph structures**

When not to use

- **Extensive batch operations** are required
 - Multiple nodes / relationships are to be affected
- **Only too large graphs** to be stored
 - Graph distribution is difficult or impossible at all

Graph Databases

Representatives

Native XML Databases

Data model

- **XML documents**
 - Tree structure with nested **elements**, **attributes**, and text values (beside other less important constructs)
 - Documents are organized into collections

Query languages

- **XPath**: *XML Path Language* (navigation)
- **XQuery**: *XML Query Language* (querying)
- **XSLT**: *XSL Transformations* (transformation)

Representatives

- **Sedna**, **Tamino**, BaseX, eXist-db
- *Multi-model*: **MarkLogic**, OpenLink **Virtuoso**

Native XML Databases

Representatives

Native XML Database System

RDF Stores

Data model

- **RDF triples**
 - Components: **subject**, **predicate**, and **object**
 - Each triple represents a **statement** about a real-world entity
- Triples can be viewed as **graphs**
 - **Vertices** for subjects and objects
 - **Edges** directly correspond to individual statements

Query language

- **SPARQL**: *SPARQL Protocol and RDF Query Language*

Representatives

- Apache **Jena**, **rdf4j** (Sesame), Algebraix
- *Multi-model*: **MarkLogic**, OpenLink **Virtuoso**

RDF Stores

Representatives

Features of NoSQL Databases

Data model

- Traditional approach: relational model
- (New) possibilities:
 - **Key-value, document, wide column, graph**
 - Object, XML, RDF, ...
- Goal
 - Respect the real-world nature of data
(i.e. data structure and mutual relationships)

Features of NoSQL Databases

Aggregate structure

- **Aggregate** definition
 - Data unit with a complex structure
 - **Collection of related data pieces we wish to treat as a unit** (with respect to data manipulation and data consistency)
- Examples
 - **Value** part of key-value pairs in key-value stores
 - **Document** in document stores
 - **Row** of a **column family** in wide column stores

Features of NoSQL Databases

Aggregate structure

- Types of systems
 - **Aggregate-ignorant**: relational, graph
 - It is not a bad thing, it is a feature
 - **Aggregate-oriented**: key-value, document, wide column
- Design notes
 - No universal strategy how to draw **aggregate boundaries**
 - **Atomicity** of database operations:
just a single aggregate at a time

Features of NoSQL Databases

Elastic scaling

- Traditional approach: **scaling-up**
 - Buying bigger servers as database load increases
- New approach: **scaling-out**
 - Distributing database data across multiple hosts
 - Graph databases (unfortunately): difficult or impossible at all

Data distribution

- **Sharding**
 - Particular ways how database data is split into separate groups
- **Replication**
 - Maintaining several data copies (performance, recovery)

Features of NoSQL Databases

Automated processes

- Traditional approach
 - Expensive and highly trained database administrators
- New approach: **automatic recovery, distribution, tuning, ...**

Relaxed consistency

- Traditional approach
 - **Strong consistency** (ACID properties and transactions)
- New approach
 - **Eventual consistency** only (BASE properties)
 - I.e. we have to make trade-offs because of the data distribution

Features of NoSQL Databases

Schemalessness

- Relational databases
 - Database schema present and **strictly enforced**
- NoSQL databases
 - **Relaxed schema** or **completely missing**
 - Consequences: **higher flexibility**
 - Dealing with **non-uniform data**
 - **Structural changes** cause no overhead
 - However: there is (usually) an **implicit schema**
 - We must know the data structure at the application level anyway

Features of NoSQL Databases

Open source

- Often community and enterprise versions (with extended features or extent of support)

Simple APIs

- Often state-less application interfaces (HTTP)

Features of NoSQL Databases

Current State: Five advantages

- **Scaling**
 - Horizontal distribution of data among hosts
- **Volume**
 - High volumes of data that cannot be handled by RDBMS
- **Administrators**
 - No longer needed because of the automated maintenance
- **Economics**
 - Usage of cheap commodity servers, lower overall costs
- **Flexibility**
 - Relaxed or missing data schema, easier design changes

Features of NoSQL Databases

Current State: Five challenges

- **Maturity**
 - Often still in pre-production phase with key features missing
- **Support**
 - Mostly open source, limited sources of credibility
- **Administration**
 - Sometimes relatively difficult to install and maintain
- **Analytics**
 - Missing support for business intelligence and ad-hoc querying
- **Expertise**
 - Still low number of NoSQL experts available in the market

Conclusion

The end of relational databases?

- Certainly no
 - They are still suitable for most projects
 - Familiarity, stability, feature set, available support, ...
- However, we should also consider different database models and systems
 - **Polyglot persistence** = **usage of different data stores in different circumstances**

Lecture Conclusion

Big Data

- 4V characteristics: volume, variety, velocity, veracity

NoSQL databases

- (New) **logical models**
 - Core: key-value, wide column, document, graph
 - Non-core: XML, RDF, ...
- (New) **principles and features**
 - Horizontal scaling, data sharding and replication, eventual consistency, ...

Course Overview

Outline and Objectives

Principles

- **Scaling, distribution, consistency**
- Transactions, visualization, ...

Technologies

- **MapReduce** programming model
 - Apache Hadoop
- **Data formats**
 - XML, JSON, RDF, ...
- **NoSQL databases**
 - Core: **RiakKV, Redis, MongoDB, Cassandra, Neo4j**
 - Non-core: XML, RDF
 - *Data models, query languages, ...*
