Lecture 8

# **Graph Databases: Neo4j**

Martin Svoboda svoboda@ksi.mff.cuni.cz

21. 11. 2016

**Charles University in Prague**, Faculty of Mathematics and Physics **Czech Technical University in Prague**, Faculty of Electrical Engineering

## **Lecture Outline**

### **Graph databases**

General introduction

## Neo4j

- Data model: property graphs
- Traversal framework
- Cypher query language
  - Read, write and general clauses

#### Data model

- Property graphs
  - Directed / undirected graphs, i.e. collections of ...
    - nodes (vertices) for real-world entities, and
    - relationships (edges) among these nodes
  - Both the nodes and relationships can be associated with additional properties

### Types of databases

- Non-transactional = small number of very large graphs
- Transactional = large number of small graphs

### Query patterns

- Create, update or remove a node / relationship in a graph
- Graph algorithms (shortest paths, spanning trees, ...)
- General graph traversals
- Sub-graph queries or super-graph queries
- Similarity based queries (approximate matching)

### Representatives

- <u>Neo4j</u>, Titan, Apache Giraph, InfiniteGraph, FlockDB
- Multi-model: OrientDB, OpenLink Virtuoso, ArangoDB

#### Suitable use cases

- Social networks, routing, dispatch, and location-based services, recommendation engines, chemical compounds, biological pathways, linguistic trees, ...
  - I.e. simply for graph structures

#### When not to use

- Extensive batch operations are required
  - Multiple nodes / relationships are to be affected
- Only too large graphs to be stored
  - Graph distribution is difficult or impossible at all

### Representatives

# Neo4j Graph Database

# Neo4j

### **Graph database**

- https://neo4j.com/
- Features
  - Open source, massively scalable (billions of nodes), high availability, fault-tolerant, master-slave replication, ACID transactions, embeddable, ...
  - Expressive graph query language (Cypher), traversal framework
- Developed by Neo Technology
- Implemented in Java
- Operating systems: cross-platform
- Initial release in 2007

# **Data Model**

### Database system structure

 $Instance \rightarrow single \ \textbf{graph}$ 

## Property graph = directed labeled multigraph

Collection of vertices (nodes) and edges (relationships)

## Graph node

- Has a unique (internal) identifier
- Can be associated with a set of labels
  - Allow us to categorize nodes
- Can also be associated with a set of properties
  - Allow us to store additional data together with nodes

# **Data Model**

### Graph relationship

- Has a unique (internal) identifier
- Has a direction
  - Relationships are equally well traversed in either direction!
  - Directions can be ignored when querying
- Always has a start and end node
  - Can be recursive (i.e. loops are allowed)
- Is associated with exactly one type
- Can also be associated with a set of properties

# **Data Model**

### Node and relationship property

- Key-value pair
  - Key is a string
  - Value is an atomic value of any primitive data type, or an array of atomic values of one primitive data type

### Primitive data types

- boolean boolean values true and false
- byte, short, int, long integers (1B, 2B, 4B, 8B)
- float, double floating-point numbers (4B, 8B)
- char one Unicode character
- String sequence of Unicode characters

# Sample Data

### Sample graph with movies and actors

```
(m1:movie { id: "vratnelahve", title: "Vratné lahve", year: 2006 })
(m2:movie { id: "samotari", title: "Samotáři", year: 2000 })
(m3:movie { id: "medvidek", title: "Medvidek", year: 2007 })
(m4:movie { id: "stesti", title: "Štěstí", year: 2005 })
```

```
(a1:actor { id: "trojan", name: "Ivan Trojan", year: 1964 })
(a2:actor { id: "machacek", name: "Jiří Macháček", year: 1966 })
(a3:actor { id: "schneiderova", name: "Jitka Schneiderová", year: 1973 })
(a4:actor { id: "sverak", name: "Zdeněk Svěrák", year: 1936 })
```

```
(m1)-[c1:HAS_ACTOR { role: "Robert Landa" }]->(a2)
(m1)-[c2:HAS_ACTOR { role: "Josef Tkaloun" }]->(a4)
(m2)-[c3:HAS_ACTOR { role: "Ondřej" }]->(a1)
(m2)-[c4:HAS_ACTOR { role: "Jakub" }]->(a2)
(m2)-[c5:HAS_ACTOR { role: "Hanka" }]->(a3)
(m3)-[c6:HAS_ACTOR { role: "Ivan" }]->(a1)
(m3)-[c7:HAS_ACTOR { role: "Jirka", award: "Czech Lion" }]->(a2)
```

#### **Traversal framework**

- Allows us to express and execute graph traversal queries
- Based on callbacks, executed lazily

### **Traversal description**

Defines rules and other characteristics of a traversal

#### **Traverser**

- Initiates and manages a particular graph traversal according to...
  - the provided traversal description, and
  - graph node / set of nodes where the traversal starts
- Allows for the iteration over the matching paths, one by one

### Components of a traversal description

- Expanders
  - What relationships should be considered
- Order
  - Which graph traversal algorithm should be used
- Uniqueness
  - Whether nodes / relationships can be visited repeatedly
- Evaluators
  - When the traversal should be terminated
  - What paths should be included in the query result

#### **Traversal Description**

### Path expanders

Being at a given node... what relationships should next be followed?

- Expander specifies one allowed...
  - relationship type and direction
    - Direction.INCOMING
    - Direction.OUTGOING
    - Direction.BOTH
- Multiple expanders can be specified at once
  - When none is provided, then all the relationships are permitted
- Usage: td.relationships(type, direction)

#### **Traversal Description**

#### Order

Which graph traversal algorithm should be used?

- Standard depth-first or breadth-first methods can be selected or specific branch ordering policies can also be implemented
- Usage: td.breadthFirst() td.depthFirst()

**Traversal Description** 

## Uniqueness

Can particular nodes / relationships be revisited?

- Various uniqueness levels are provided
  - Uniqueness.NONE no filter is applied
  - Uniqueness.NODE\_PATHUniqueness.RELATIONSHIP\_PATH
    - Nodes / relationships within a current path must be distinct
  - Uniqueness.NODE\_GLOBAL (default)
     Uniqueness.RELATIONSHIP\_GLOBAL
    - No node / relationship may be visited more than once
  - ..
- Usage: td.uniqueness(level)

#### **Traversal Description**

#### **Evaluators**

Considering a particular path...

should this path be included in the result?

should the traversal further continue?

- Available evaluation actions
  - Evaluation.INCLUDE\_AND\_CONTINUE
     Evaluation.INCLUDE\_AND\_PRUNE
     Evaluation.EXCLUDE\_AND\_CONTINUE
     Evaluation.EXCLUDE\_AND\_PRUNE
- Meaning of these actions
  - INCLUDE / EXCLUDE = whether to include the path in the result
  - CONTINUE / PRUNE = whether to continue the traversal

#### **Traversal Description**

#### **Evaluators**

- Predefined evaluators
  - Evaluators.all()
    - Never prunes, includes everything
  - Evaluators.excludeStartPosition()
    - Never prunes, includes everything except the starting positions

```
Evaluators.atDepth(depth)
Evaluators.toDepth(maxDepth)
Evaluators.fromDepth(minDepth)
Evaluators.includingDepths(minDepth, maxDepth)
```

Includes only positions within the specified interval of depths

. .

#### **Traversal Description**

#### **Evaluators**

- Usage: td.evaluator(evaluator)
- Note that evaluators are applied even for the starting nodes!
- When multiple evaluators are provided...
  - then they must all agree on each of the two questions

#### Path

Well-formed sequence of interleaved nodes and relationships

#### Traverser

- Allows us to perform a particular graph traversal
  - with respect to a given traversal description
  - starting at a given node / nodes

```
Usage: t = td.traverse(node, ...)
    for (Path p : t) { ... }
```

- Iterates over all the paths
- for (Node n : t.nodes()) { ... }
  - Iterates over all the paths, returns their end nodes
- for (Relationship r : t.relationships()) { ... }
  - Iterates over all the paths, returns their last relationships

# **Examples**

### Find all the actors that played in Medvidek movie

```
TraversalDescription td = db.traversalDescription()
  .breadthFirst()
  .relationships(Types.HAS_ACTOR, Direction.OUTGOING)
  .evaluator(Evaluators.atDepth(1));
Node s = db.findNode(Label.label("movie"), "id", "medvidek");
Traverser t = td.traverse(s):
for (Path p : t) {
 Node n = p.endNode();
 System.out.println(
   n.getProperty("name")
 );
```

```
Ivan Trojan
Jiří Macháček
```

# **Examples**

### Find all the actors that played with Zdeněk Svěrák

```
TraversalDescription td = db.traversalDescription()
  .depthFirst()
  .uniqueness(Uniqueness.NODE GLOBAL)
  .relationships(Types.HAS_ACTOR)
  .evaluator(Evaluators.atDepth(2))
  .evaluator(Evaluators.excludeStartPosition());
Node s = db.findNode(Label.label("actor"), "id", "sverak");
Traverser t = td.traverse(s):
for (Node n : t.nodes()) {
 System.out.println(
    n.getProperty("name")
  ):
```

```
Jiří Macháček
```

# Cypher

## Cypher

- Declarative graph query language
  - Allows for expressive and efficient querying and updates
  - Inspired by SQL (query clauses) and SPARQL (pattern matching)
- OpenCypher
  - Ongoing project aiming at Cypher standardization
  - http://www.opencypher.org/

#### Clauses

- E.g. MATCH, RETURN, CREATE, ...
- Clauses are (almost arbitrarily) chained together
  - Intermediate result of one clause is passed to a subsequent one

# **Cypher Clauses**

#### Read clauses and sub-clauses

- MATCH specifies graph patterns to be searched for
  - WHERE adds additional filtering constraints
- ..

#### Write clauses and sub-clauses

- CREATE creates new nodes or relationships
- DELETE deletes nodes or relationships
- SET updates labels or properties
- REMOVE removes labels or properties
- •

# **Cypher Clauses**

#### **General clauses** and sub-clauses

- RETURN defines what the query result should contain
  - ORDER BY describes how the query result should be ordered
  - SKIP excludes certain number of solutions from the result
  - LIMIT limits the number of solutions to be included
- WITH allows query parts to be chained together
- ..

# Sample Query

## Find names of all the actors that played in Medvidek movie

```
MATCH (m:movie)-[r:HAS_ACTOR]->(a:actor)
WHERE m.title = "Medvidek"
RETURN a.name, a.year
ORDER BY a.year
```

a.name	a.year
Ivan Trojan	1964
Jiří Macháček	1966

### Path pattern expression

- ASCII-Art inspired syntax
  - Circles () for nodes
  - Arrows <--, --, --> for relationships
- Describes a single <u>path</u> pattern (not a general subgraph)

### Node pattern

Matches one data node

- Variable
  - Used to access a given query node later on
- Set of labels
  - Data node must have all the specified labels to be matched
- Property map
  - Data node must have all the requested properties (including their values) to be matched (the order is unimportant)

## **Property** map

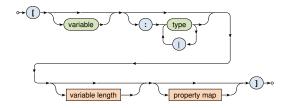

## Relationship pattern

Matches one data relationship

### Relationship pattern

- Variable
  - Used to access a given query relationship later on
- Set of types
  - Data relationship must be of one of the allowed types to be matched

### Relationship pattern

- ...
- Property map
  - Data relationship must have all the requested properties
- Variable path length
  - Allows us to describe paths of arbitrary lengths (not just one relationship)

I.e. matches a general path, not just a single relationship

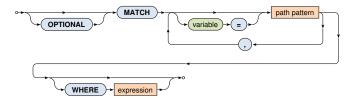

### **Examples**

```
()
(x) - -(y)
(m:movie)-->(a:actor)
(:movie)-->(a { name: "Ivan Trojan" })
() <- [r: HAS_ACTOR] - ()
(m)-[:HAS_ACTOR { role: "Ivan" }]->()
(:actor { name: "Ivan Trojan" })-[:KNOWS *2]->(:Actor)
()-[:KNOWS *5..]->(f)
```

# **Match Clause**

#### MATCH clause

- Allows to search for sub-graphs of the data graph that match the provided path pattern / patterns (all of them)
  - Query result (table) = unordered set of solutions
  - One solution (row) = set of variable bindings
- Each variable has to be bound

# **Match Clause**

## WHERE sub-clause may provide additional constraints

- These constraints are evaluated directly during the matching phase (i.e. not after it)
- Typical usage
  - Boolean expressions
  - Comparisons
  - Path patterns true if at least one solution is found
  - ..

## **Uniqueness requirement**

 One data node may match several query nodes, but one data relationship <u>may not</u> match several query relationships

# **Match Clause**

#### Example

## Find names of actors who played with Ivan Trojan in any movie

```
MATCH (i:actor)<-[:HAS_ACTOR]-(:movie)-[:HAS_ACTOR]->(a:actor)
WHERE (i.name = "Ivan Trojan")
RETURN a.name
```

a.name Jiří Macháček Jitka Schneiderová Jiří Macháček

## **Match Clause**

#### OPTIONAL MATCH

- Attempts to find matching data sub-graphs as usual...
- but when no solution is found, one specific solution with all the variables bound to NULL is generated
- Note that either the whole pattern is matched, or nothing is matched

# **Match Clause**

### **Example**

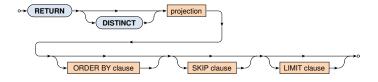

Find all the movies filmed in 2005 or earlier, return names of all their actors as well (if any)

```
MATCH (m:movie)
WHERE (m.year <= 2005)
OPTIONAL MATCH (m)-[:HAS_ACTOR]->(a:actor)
RETURN m.title, a.name
```

m.title	a.name
Samotáři	Ivan Trojan
Samotáři	Jiří Macháček
Samotáři	Jitka Schneiderová
Štěstí	NULL

### RETURN clause

- Defines what to include in the query result
  - Projection of variables, accessing properties via dot notation, aggregation functions, ...
- Optional ORDER BY, SKIP and LIMIT sub-clauses

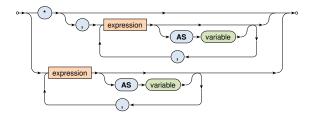

### RETURN DISTINCT

Duplicate solutions (rows) are removed

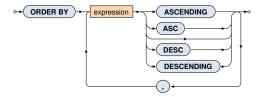

## **Projection**

- \* = all the variables
  - Can only be specified as the very first item
- AS allows to explicitly (re)name output records

### ORDER BY sub-clause

- Defines the order of solutions within the query result
  - Multiple criteria can be specified
  - Default direction is ASC
- The order is undefined unless explicitly defined
- Nodes and relationships as such cannot be used as criteria

### SKIP sub-clause

 Defines the number of solutions to be skipped in the query result

### LIMIT sub-clause

 Defines the number of solutions to be included in the query result

# With Clause

### WITH clause

- Constructs intermediate result
  - Behaves analogously to the RETURN clause
  - Does not output anything to the user, just forwards the current result to the subsequent clause
- Optional WHERE sub-clause can also be provided

### Query clauses evaluation in general

- WITH and RETURN clauses terminate individual query parts
- Within each query part...
  - All the read clauses are evaluated first (if any),
     only then the write clauses are evaluated (if any)
- Read-only queries must return data (i.e. must contain RETURN clause)

### Write clauses and sub-clauses

- CREATE creates new nodes or relationships
- DELETE deletes nodes or relationships
- SET updates labels or properties
- REMOVE removes labels or properties

### **CREATE clause**

Inserts new nodes or relationships into the data graph

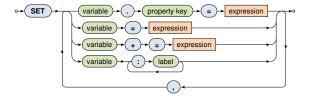

### DELETE clause

- Removes nodes, relationships or paths from the data graph
- Relationships must be removed before the nodes they are associated with
  - Unless the DETACH modifier is specified

### SET clause

- Allows to...
  - set a value for a particular property
    - or remove a property when NULL is assigned
  - replace all the current properties with new ones
  - add new properties to the existing ones
  - add labels to nodes
- Cannot be used to set relationship types

### REMOVE clause

- Allows to...
  - remove a particular property
  - remove labels from nodes
- Cannot be used to remove relationship types

# **Expressions**

## **Literal** expressions

- Integers: decimal, octal, hexadecimal
- Floating-point numbers
- Strings
  - Enclosed in double or single quotes
  - Standard escape sequences
- Boolean values: true, false
- NULL value (cannot be stored in data graphs)

### Other **expressions**

 Collections, variables, property accessors, function calls, path patterns, boolean expressions, arithmetic expressions, comparisons, regular expressions, predicates, ...

# **Lecture Conclusion**

### **Neo4j** = graph database

- Property graphs
- Traversal framework
  - Path expanders, uniqueness, evaluators, traverser

## **Cypher** = graph query language

- Read (sub-)clauses: MATCH, WHERE, ...
- Write (sub-)clauses: CREATE, DELETE, SET, REMOVE, ...
- General (sub-)clauses: RETURN, WITH, ORDER BY, LIMIT, ...
