**Czech Technical University in Prague**, Faculty of Electrical Engineering

# Redis

## Redis

- **In-memory data structure store**
  - Open source, master-slave replication architecture, sharding, high availability, various persistence levels, ...
- <http://redis.io/>
- Developed by **Redis Labs**
- Implemented in **C**
- First release in 2009

# Redis

## Functionality

- Standard **key-value store**
- Support for **structured values** (e.g. lists, sets, ...)
- **Time-to-live**
- Transactions

## Real-world users

- Twitter, GitHub, Pinterest, StackOverflow, Flicker, ...

# Data Model

## Data model

Instance → **databases** → **objects**

- **Database** = collection of objects
  - Databases do not have names but integer identifiers
- **Object** = key-value pair
  - Key is a **string** (i.e. any binary data)
  - Values can be...
    - Atomic: **string**
    - Structured: **list**, **set**, **sorted set**, **hash**

# Data Types

## Available **data types**

- **String**
  - The only **atomic data type**
  - May contain any binary data  
(e.g. string, integer counter, PNG image, ...)
  - Maximal allowed size is 512 MB
- **List**
  - **Ordered collection of strings**
  - Elements should preferably be read / written at the head / tail

# Data Types

## Available **data types**

- **Set**
  - **Unordered collection of strings**
  - Duplicate values are not allowed
- **Sorted set**
  - **Ordered collection of strings**
  - The order is given by a score (floating number value) associated with each element (from the smallest to the greatest score)
- **Hash**
  - **Associative map between string fields and string values**
  - Field names have to be mutually distinct

# Interface

redis-cli command line client

- Two modes are available...
- **Basic**
  - Commands are passed as standard command line arguments
  - E.g. redis-cli PING  
redis-cli -n 16 DBSIZE
  - Batch processing is possible as well
  - E.g. cat script.txt | redis-cli
- **Interactive**
  - Users type database commands at the prompt
  - redis-cli

**RESP** (*REdis Serialization Protocol*)

# First Steps

## Connect to our NoSQL server

- SSH / SFTP and PuTTY / WinSCP
- **nosql.ms.mff.cuni.cz:42222**

## Check Redis status

- redis-cli PING

## Open Redis client (interactive mode)

- redis-cli

## Select your database

- **SELECT number**
- Your database number: sent by e-mail

# First Steps

## Basic Commands

- **HELP command**
  - Provides basic information about Redis commands
- **CLEAR**
  - Clears the terminal screen
- **FLUSHDB**
  - Deletes all the keys in the currently selected database
- **BGSAVE**
  - Saves the current dataset (asynchronously, on background)
  - I.e. stores the database snapshot to the hard drive
- **QUIT**
  - Closes the connection

# Strings

## Basic commands

- **SET** `key value` – inserts / replaces a given string
- **GET** `key` – returns a given string

## String operations

- **STRLEN** `key` – returns a string length
- **APPEND** `key value` – appends a value at the end of a string
- **GETRANGE** `key start end` – returns a substring
  - Both the boundaries are considered to be inclusive
  - Positions start at 0
  - Negative offsets for positions starting at the end
- **SETRANGE** `key offset value` – replaces a substring
  - Binary 0 are padded when the original string is not long enough

# Strings

## Counter operations

- **INCR key**  
**DECR key**
  - Increments / decrements a value by 1
- **INCRBY key increment**  
**DECRBY key decrement**
  - Increments / decrements a value by a given amount

# Objects

## Object querying

- **EXISTS key** – determines whether a key exists
- **KEYS pattern** – finds all the keys matching a pattern (\*, ?, ...)
  - E.g. KEYS \*

## Modification of objects

- **DEL key ...** – removes a given object / objects
- **RENAME key newkey** – changes key of a given object

## Type information

- **TYPE key** – determines the type of a given object
  - Types: string, list, set, zset and hash

# Volatile Objects

## Keys with limited time to live

- When a specified timeout elapses, a given object is removed
- Works with any data type

## Commands

- **EXPIRE key seconds**
  - Sets a timeout for a given object, i.e. makes the object volatile
  - Can be called repeatedly to change the timeout
- **TTL key**
  - Returns the remaining time to live for a key that has a timeout
- **PERSIST key**
  - Removes the existing timeout, i.e. makes the object persistent

# Lists

## Insertion of new elements

- **LPUSH key value**  
**RPUSH key value**
  - Adds a new element to the head / tail
- **LINSERT key BEFORE|AFTER pivot value**
  - Inserts an element before / after another one

## Retrieval of elements

- **LPOP key**  
**RPOP key**
  - Removes and returns the first / last element

# Lists

## Retrieval of elements

- **LINDEX key index** – gets an element by its index
  - The first item is at position 0
  - Negative positions are allowed as well
- **LRANGE key start stop** – gets a range of elements

## Removal of elements

- **LREM key count value**
  - Removes a given number of matching elements from a list
    - Positive / negative = moving from head to tail / tail to head
    - 0 = all the items are removed

## Other operations

- **LLEN key** – gets the length of a list

# Sets

## Basic operations

- **SADD** `key value ...`
  - Adds an element / elements into a set
- **SREM** `key value ...`
  - Removes an element / elements from a set

## Data querying

- **SISMEMBER** `key value`
  - Determines whether a set contains a given element
- **SMEMBERS** `key` – gets all the elements of a set

## Other operations

- **SCARD** `key` – gets the number of elements in a set

# Sets

## Set operations

- **SUNION key ...**  
**SINTER key ...**  
**SDIFF key ...**
  - Calculates and returns a set union / intersection / difference of two or more sets

# Hashes

## Basic operations

- **HSET** `key field value` – sets the value of a hash field
- **HGET** `key field` – gets the value of a hash field

## Batch alternatives

- **HMSET** `key field value ... ...`
  - Sets values of multiple fields of a given hash
- **HMGET** `key field ...`
  - Gets values of multiple fields of a given hash

# Hashes

## Field retrieval operations

- **HEXISTS** `key field` – determines whether a field exists
- **HGETALL** `key` – gets all the fields and values
  - Individual fields and values are interleaved
- **HKEYS** `key` – gets all the fields in a given hash
- **HVALS** `key` – gets all the values in a given hash

## Other operations

- **HDEL** `key field ...`
  - Removes a given field / fields from a hash
- **HLEN** `key` – returns the number of fields in a given hash

# Sorted Sets

## Basic operations

- **ZADD key score value ...**
  - Inserts one element / multiple elements into a sorted set
- **ZREM key value ...**
  - Removes one element / multiple elements from a sorted set

## Working with score

- **ZSCORE key value**
  - Gets the score associated with a given element
- **ZINCRBY key increment value**
  - Increments the score of a given element

# Sorted Sets

## Retrieval of elements

- **ZRANGE key start stop**
  - Returns all the elements within a given range based on positions
- **ZRANGEBYSCORE key min max**
  - Returns all the elements within a given range based on scores

## Other operations

- **ZCARD key**
  - Gets the overall number of all elements
- **ZCOUNT key min max**
  - Counts all the elements within a given range based on score
